

## **Air Pressure Stabiliser - Protective Guard**

The guards are designed to offer protection to Air Pressure Stabilisers when fitted in areas where they may be classed as vulnerable to accidental damage. These units are typically those fitted at low levels or in positions where personnel may be moving equipment around within a facility with the potential risk of damaging the Air Pressure Stabilisers.

As Air Pressure Stabilisers are precision-balanced items of equipment, it makes sense to protect them to avoid costly and unnecessary repairs and downtime for the facility.

The guards sized to fit to the flanges of the relevant Air Pressure Stabiliser unit, and are finished in durable white plastic coating.
