

# Air Pressure Stabiliser Fumigation/Sealing Plate

Data Sheet

## Air Pressure Stabiliser - Fumigation/Sealing Plate

Designed to seal against one client nominated side of an Air Pressure Stabiliser, these plates are typically required when a facility requires one or more of its rooms/areas to undergo a fumigation process, to protect adjacent rooms/areas from the ingress of fumigant.

Each plate utilises an EPDM foam seal which is compressed against the outer flange face of the unit to provide an air-tight seal. Threaded holes are located on the flange of the Air Pressure Stabiliser to which the plate is then fixed and tightened using the retained thumb-turn screws provided.

The plates are sized to fit to the flanges of the relevant Air Pressure Stabiliser unit, and are finished in durable white polyester powder coating.
